

Helpdoc & QE emacs modes

((Anton Kokalj

Jožef Stefan Institute, Ljubljana, Slovenia))

What is “helpdoc” ?

- ▼ a small utility in `dev-tools/` that transforms `INPUT_*.def` into `INPUT_*.html|txt` and `PWgui` help files, **etc.**

Why helpdoc ?

- ▼ in the “old” days the usage of a *.x program was explained with a plain text INPUT_* file
- ▼ Basic idea of **helpdoc**:
 - ▼ to make INPUT_* computer semantic  *this can be exploited in a number of ways*
 - ▼ to yield a more user friendly documentation
 - ▼ transformation of INPUT_* files should not involve much human effort

Helpdoc: how it works

- ▼ a small utility in `dev-tools/` that transforms `INPUT_*.def` into `INPUT_*.html|txt` and `PWgui` help files, **etc.**

Helpdoc's *.def markup

▼ *.def markup is more compact than XML markup

▼ def:

```
var etot_conv_thr -type REAL {  
  default { 1.0D-4 }  
  info {  
    convergence threshold on total energy (a.u) for ...  
  }  
}
```

▼ XML:

```
<var name="etot_conv_thr" type="REAL">  
  <default> 1.0D-4 </default>  
  <info>  
    convergence threshold on total energy (a.u) for ...  
  </info>  
</var>
```

Helpdoc's *.def markup

▼ How to:

take an existing *.def file and use it as a template

- ▼ syntax is shortly explained in [dev-tools/README.helpdoc](#)
- ▼ syntax/structure is formally described by the schema:
[dev-tools/helpdoc.schema](#)

Text is treated as pre-formatted

```
var wf_collect -type LOGICAL {  
  default { .FALSE. }  
  info {
```

ident is skipped

This flag controls the way wavefunctions are stored to disk :

.TRUE. collect wavefunctions from all processors, store them into the output data directory "outdir"/"prefix".save, ...

recommended width ~ 70 – 80 characters

.FALSE. do not collect wavefunctions, leave them in temporary local files (one per processor). The resulting format ...

Note that this flag has no effect on reading, only on writing.

```
}  
}
```

wf_collect	LOGICAL
Default:	.FALSE.
<p>This flag controls the way wavefunctions are stored to disk :</p> <p>.TRUE. collect wavefunctions from all processors, store them into the output data directory "outdir"/"prefix".save, ...</p> <p>.FALSE. do not collect wavefunctions, leave them in temporary local files (one per processor). The resulting format ...</p> <p>Note that this flag has no effect on reading, only on writing.</p>	

Helpdoc: new features

- ▼ **option variables:** options can be semantically defined via **options**

```
var smearing -type CHARACTER {  
  default { 'gaussian' }  
  options {  
    info { Available options are: }  
    opt -val {'gaussian', 'gauss'} {  
      ordinary Gaussian spreading (Default)  
    }  
    opt -val {'methfessel-paxton', 'm-p', 'mp'} {  
      Methfessel-Paxton first-order spreading  
      (see PRB 40, 3616 (1989)).  
    }  
    ...  
  }  
}
```

smearing	CHARACTER
----------	-----------

Default:	'gaussian'
----------	------------

Available options are:

'gaussian', 'gauss' :
ordinary Gaussian spreading (Default)

'methfessel-paxton', 'm-p', 'mp' :
Methfessel-Paxton first-order spreading
(see [PRB 40, 3616 \(1989\)](#)).

'marzari-vanderbilt', 'cold', 'm-v', 'mv' :
Marzari-Vanderbilt cold smearing
(see [PRL 82, 3296 \(1999\)](#))

Helpdoc: new features

- ▼ the following are automatically turned into hyperlinks:

```
PRB 40, 3616 (1989)
PRL 82, 3296 (1999)
arXiv:cond-mat/0504077
doi: 10.1038/srep24603
http://www.quantum-espresso.org/
```

- ▼ @-prefixed tags within the text, i.e.: `@tag { text }`

- ▼ hyperlinks:

<code>@ref</code> identifier	<i>(identified = variable, namelist, card name)</i>
<code>@link</code> document	<i>(document = external file, web-page)</i>

- ▼ primitive HTML tags for fancier formatting: `@b`, `@i`, `@u`, `@br`, `@hr`, `@p`

Helpdoc: @tag example

```
var ion_dynamics -type CHARACTER {
  options {
    info {
      See also: @link README.ion_dynamics

      @b CASE ( @ref calculation == 'relax' )
    }
    opt -val 'bfgs' {
      @b (default) use BFGS quasi-newton algorithm,
      based on the trust radius procedure, ...
    }
    ...
  }
}
```

ion_dynamics	CHARACTER
--------------	-----------

See also: [README.ion_dynamics](#)

CASE ([calculation](#) == 'relax')

'bfgs' :
(default) use BFGS quasi-newton algorithm,
based on the trust radius procedure,
for structural relaxation

'damp' :
use damped (quick-min Verlet)
dynamics for structural relaxation

Various usage of helpdoc

▼ `INPUT_*.def` files can be exploited in a number of ways

- (1) **html** description of input files ✓
- (2) semi-automated updating of **PWgui** ✓
- (3) templated automatic generation of **QE emacs modes** ✓
- (4) semi-automated updating of **pwtk** (scripting interface for PWscf)

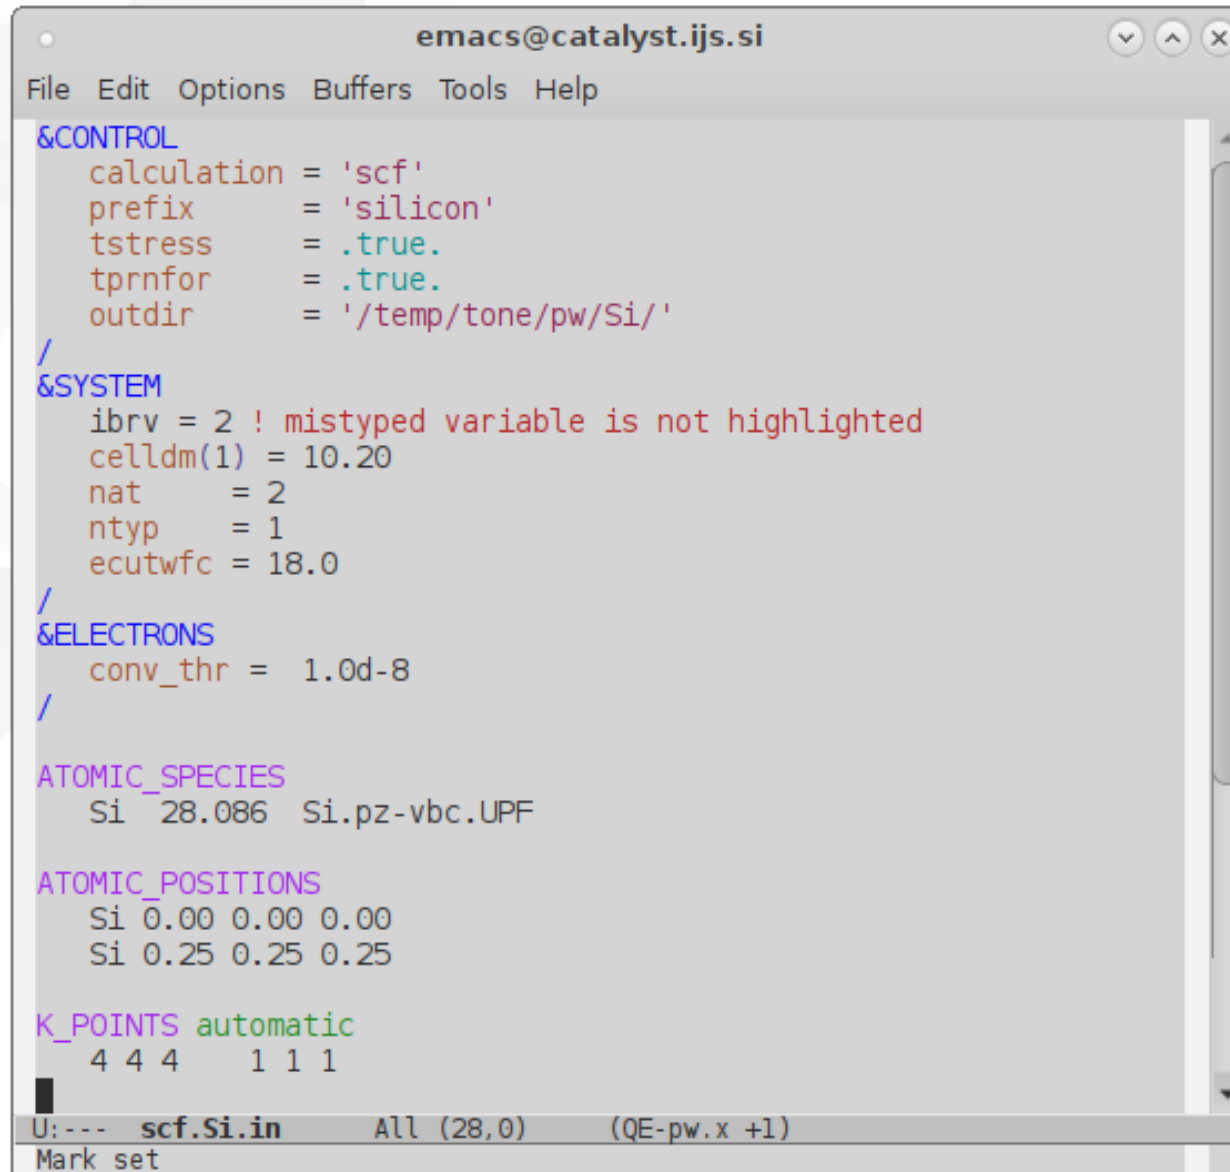

QE emacs modes

- ▼ *a collection of **Emacs** major-modes for making the editing of **Quantum ESPRESSO** input files easier and more comfortable with Emacs*
- ▼ syntax-highlighting
- ▼ auto-indentation, auto-completion
- ▼ several utility commands

QE emacs modes

The screenshot shows an Emacs window titled 'emacs@catalyst.ijs.si'. The menu bar includes 'File', 'Edit', 'Options', 'Buffers', 'Tools', and 'Help'. The main text area contains a Quantum ESPRESSO input file with the following content:

```
&CONTROL
  calculation = 'scf'
  prefix      = 'silicon'
  tstress     = .true.
  tprnfor     = .true.
  outdir      = '/temp/tone/pw/Si/'
/
&SYSTEM
  ibrv = 2 ! mistyped variable is not highlighted
  celldm(1) = 10.20
  nat     = 2
  ntyp    = 1
  ecutwfc = 18.0
/
&ELECTRONS
  conv_thr = 1.0d-8
/

ATOMIC_SPECIES
  Si 28.086 Si.pz-vbc.UPF

ATOMIC_POSITIONS
  Si 0.00 0.00 0.00
  Si 0.25 0.25 0.25

K_POINTS automatic
  4 4 4 1 1 1
```

The status bar at the bottom displays 'U:--- scf.Si.in All (28,0) (QE-pw.x +1)' and 'Mark set'.

QE emacs modes

- ▼ available modes:

specific: `pw`, `neb`, `cp`, `ph`, `ld1`, `pp`

generic: `qe`

- ▼ some useful commands:

- ▼ `M-X prog-insert-template`

(currently available for: `pw`, `neb`, `pp`, `projwfc`, `dos`, `bands`)

Notice: exemplar inputs required for other programs !!!

- ▼ `M-X prog-NAMELIST`

- ▼ `M-X prog-CARD`

- ▼ `M-X prog-variable`

Thank you for your attention !
